

Multi-timescale visualization at $\bar{g} = 0.45$, fixed $\nu = \sigma_U^2/(2\alpha) = 1.25 \times 10^{-3}$
 three correlation rates spanning the resonance: fast ($\alpha = 10$), resonant ($\alpha = \omega_0$), slow ($\alpha = 0.02$)

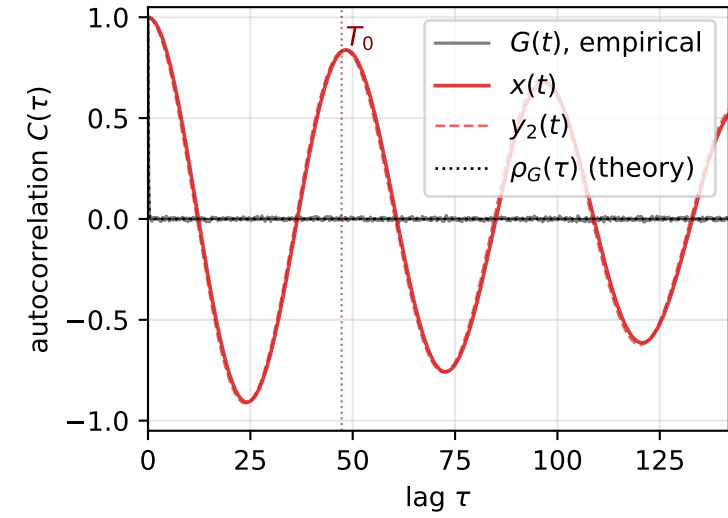

(a) $\alpha = 10.000$, $\sigma_U = 0.1581$ -- fast noise ($\tau_{OU} \ll T_0$)

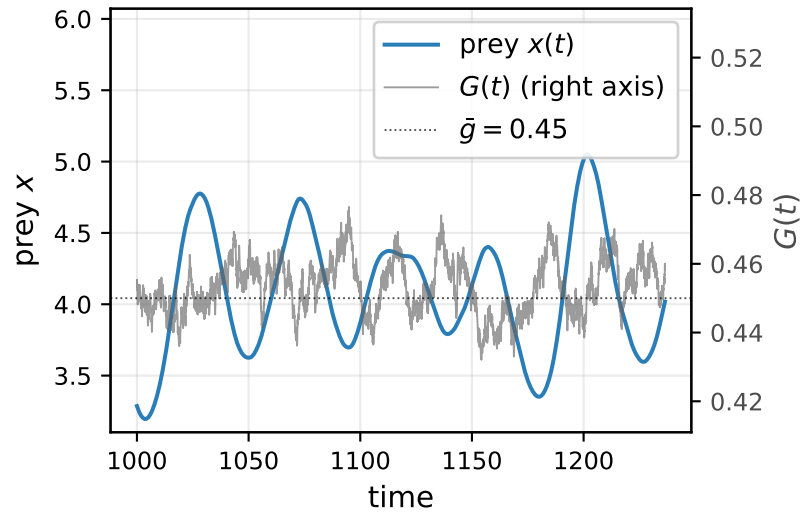

(b) Power spectrum

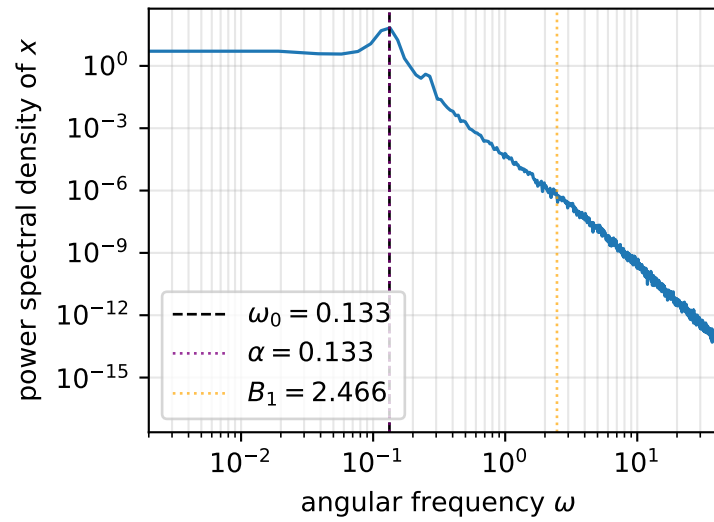

(c) Autocorrelations

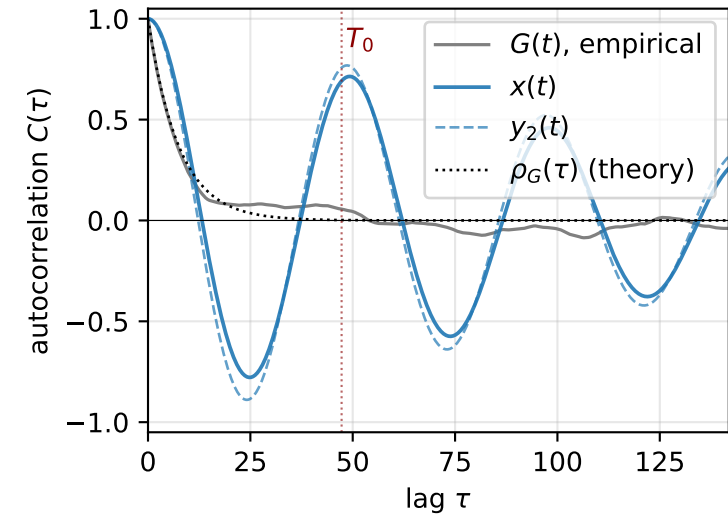

(d) $\alpha = 0.133$, $\sigma_U = 0.0182$ -- resonance ($\tau_{OU} = T_0/(2\pi)$)

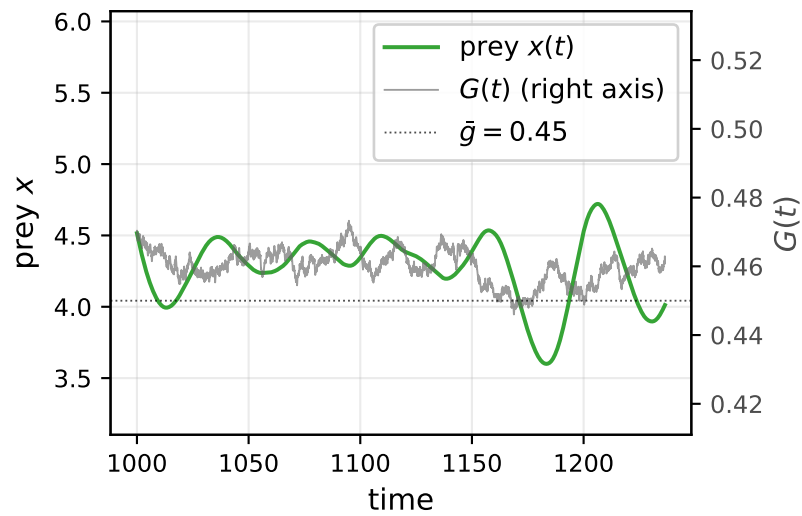

(e) Power spectrum

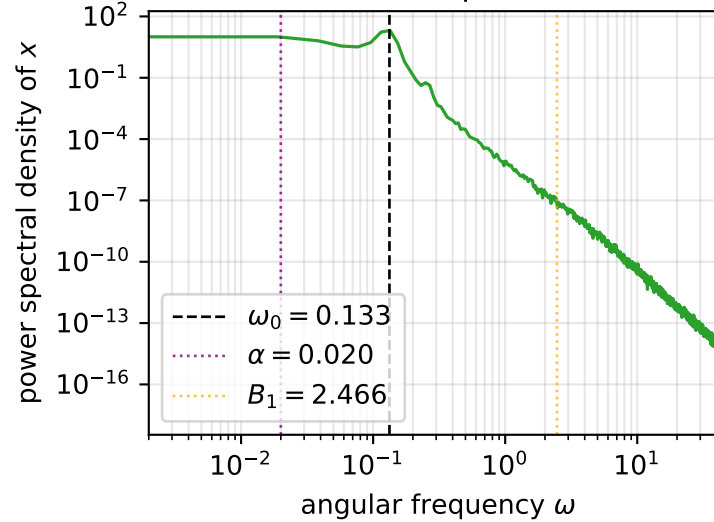

(f) Autocorrelations

(g) $\alpha = 0.020$, $\sigma_U = 0.0071$ -- slow noise ($\tau_{OU} \sim T_0$)

(h) Power spectrum

(i) Autocorrelations
